

# Quick Start

Options Rotation Momentum (V 1.0.2) — fastest path from zero to useful signals.

## 1) Add the script to a chart

Open TradingView → **Pine Editor**, paste the script, then click **Add to chart**.

Use a liquid symbol with reliable volume (index ETFs / large caps) so Flow signals behave as intended.

Start on intraday or daily; defaults are designed to stay readable across common timeframes.

## 2) Turn on External Feeds (Benchmark & VIX)

External feeds unlock Benchmark/VIX scoring plus all relative metrics (REL / dREL) and the Regime label.

- Inputs → External Feeds → **Enable External Feeds** = ON
- Confirm **Benchmark** is set (default: SPY).
- Confirm **VIX** is set (default: CBOE:VIX).

## 3) Use Guided table mode

Guided mode turns the main table into a Step 1 → Step 5 checklist.

- Inputs → Visual → **Main Table Mode** = Guided
- Inputs → Visual → **Main Table Layout** = Full (start here)
- Keep **Show Main Table** = ON

## 4) Recommended starter presets

Goal	Outlook	Higher TF	Caution Mode	Flow Strictness	Notes
Swing (default)	Medium-Term	W	VIX Spike vs SMA	Normal	Balanced for broad markets
Fast momentum	Short-Term	D	Either	Normal	More reactive; more noise
Defensive regime	Medium-Term	W	Either	Strict	Fewer Flow signals; avoids C

## 5) How to read the dashboard (in 20 seconds)

- **Step 1 (REG/CAU):** If CAUTION, reduce risk and trust Strict Flow more than Normal Flow.
- **Step 2 (HEAT v BEN):** Prefer LOC above BEN for trend tailwind.
- **Step 3 (REL / dREL):** REL > 0 is outperformance; dREL > 0 means it's improving.

- **Step 4 (FLOW):** F+ / F- only fires on volume spikes + alignment + cooldown.
- **Step 5 (RISK):** SL distance < ~1% prints WARN = tight leash.

## Alerts

Create alerts from the indicator's **Alerts** menu:

- FLOW BUY / FLOW SELL
- CAUTION TRIGGERED
- SL RISK WARNING (distance to trailing stop < ~1%)
